

Web Lab Exercise13

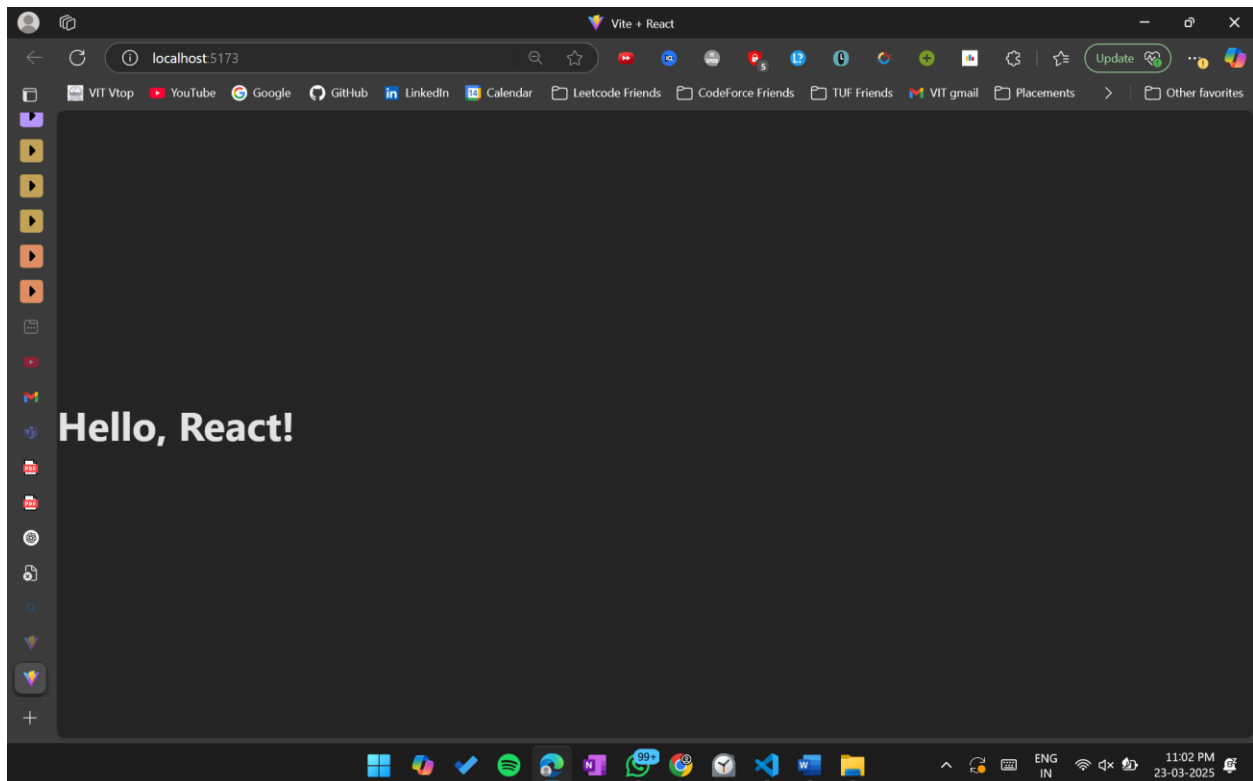

Name	Satyaprakash Swain
Reg. no	22BCE1351
Professor	Jenila Livingston M
Subject	Web Programming
Slot	L15+L16+L19+L20
Venue	AB3 – 202

1. (i) Create a React component that displays "Hello, React!" inside an <h1> tag without JSX.

```
import React from 'react';

function HelloReact() {
  return React.createElement('h1', null, 'Hello, React!');
}

export default function App() {
  return (
    <div>
      {React.createElement(HelloReact)}
    </div>
  );
}
```

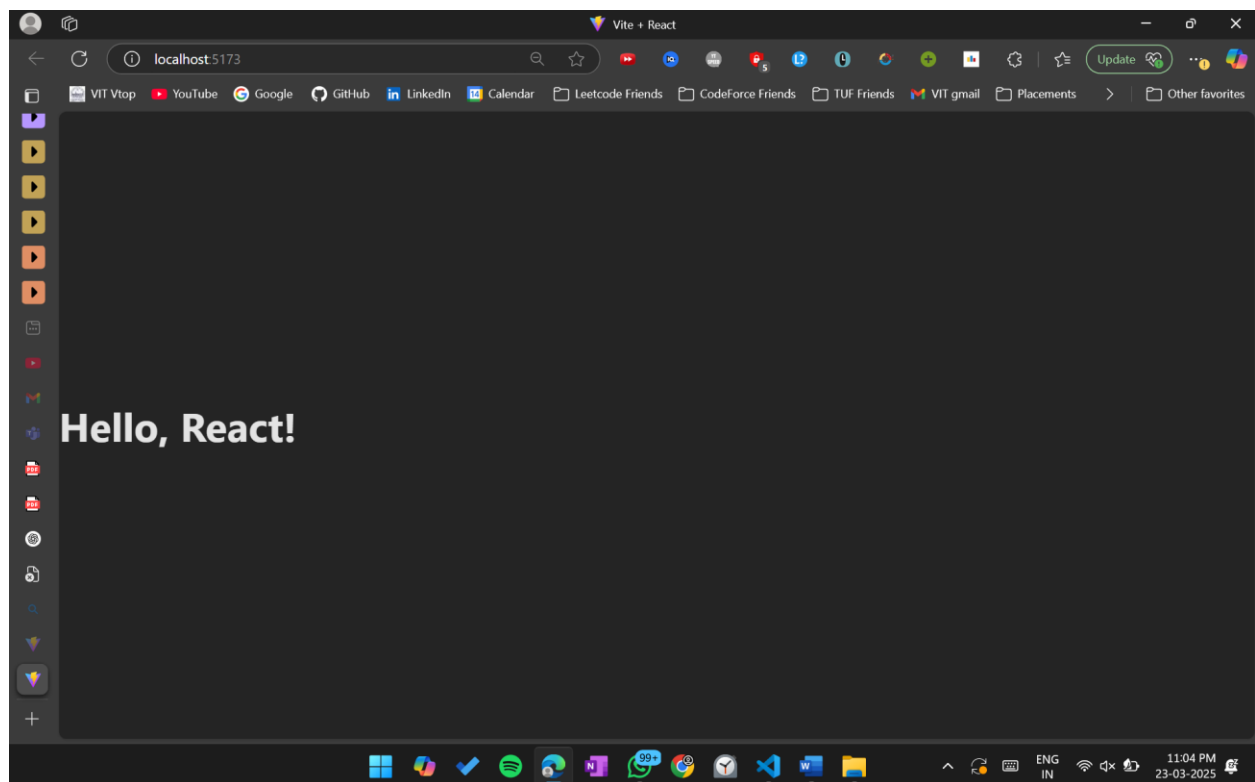

(ii) Modify the above code and solve using React JSX

```
import React from 'react';
```

```
function HelloReact() {
  return <h1>Hello, React!</h1>;
}

export default function App() {
  return (
    <div>

      <HelloReact />
    </div>
  );
}
```

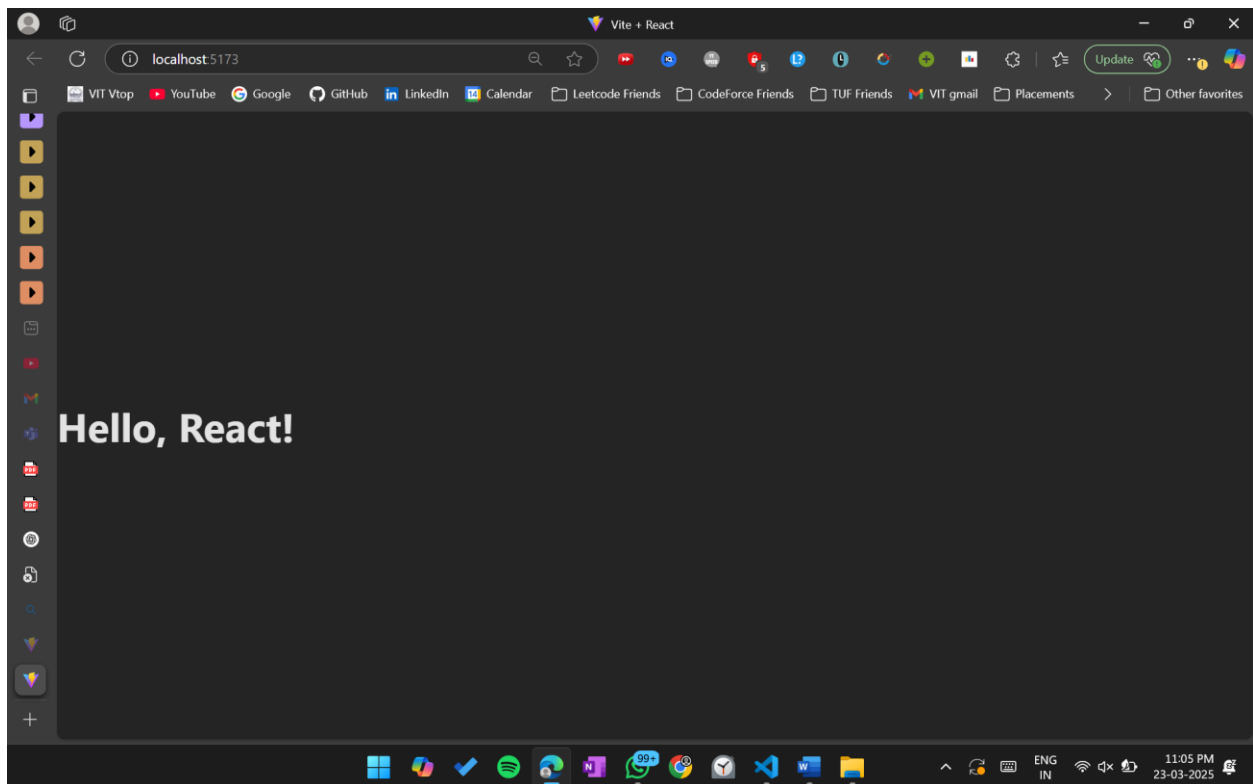

(iii) Modify the above component to display a message stored in a variable.

```
import React from 'react';

function HelloReact() {
```

```
const message = 'Hello, React!';  
return React.createElement('h1', null, message);  
}  
  
export default function App() {  
  return (  
    <div>  
      {React.createElement(HelloReact)}  
    </div>  
  );  
}
```

2. Create a component that renders a list of three fruits dynamically.

```
import React from 'react';

function FruitList() {
  const fruits = ['Apple', 'Banana', 'Cherry'];
  return (
    <ul>
      {fruits.map((fruit, index) => (
        <li key={index}>{fruit}</li>
      ))}
    </ul>
  );
}

export default function App() {
  return (
    <div>
      <h1>Fruit List</h1>
      <FruitList />
    </div>
  );
}
```

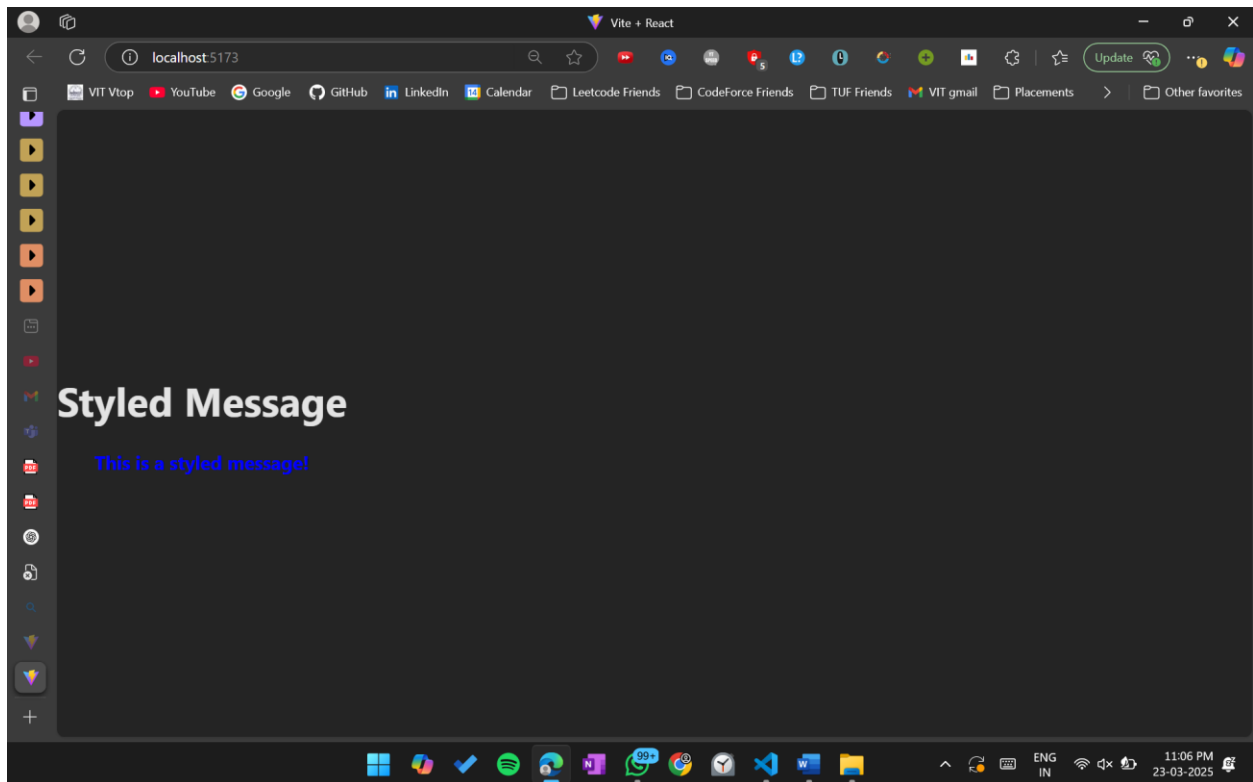

3. Create a component that displays a styled message using inline CSS in JSX.

```
import React from 'react';

function StyledMessage() {
  const styles = {
    color: 'blue',
    fontSize: '24px',
    fontWeight: 'bold',
    textAlign: 'center',
  };
  return <p style={styles}>This is a styled message!</p>;
}

export default function App() {
  return (
    <div>
      <h1>Styled Message</h1>
      <StyledMessage />
    </div>
  );
}
```

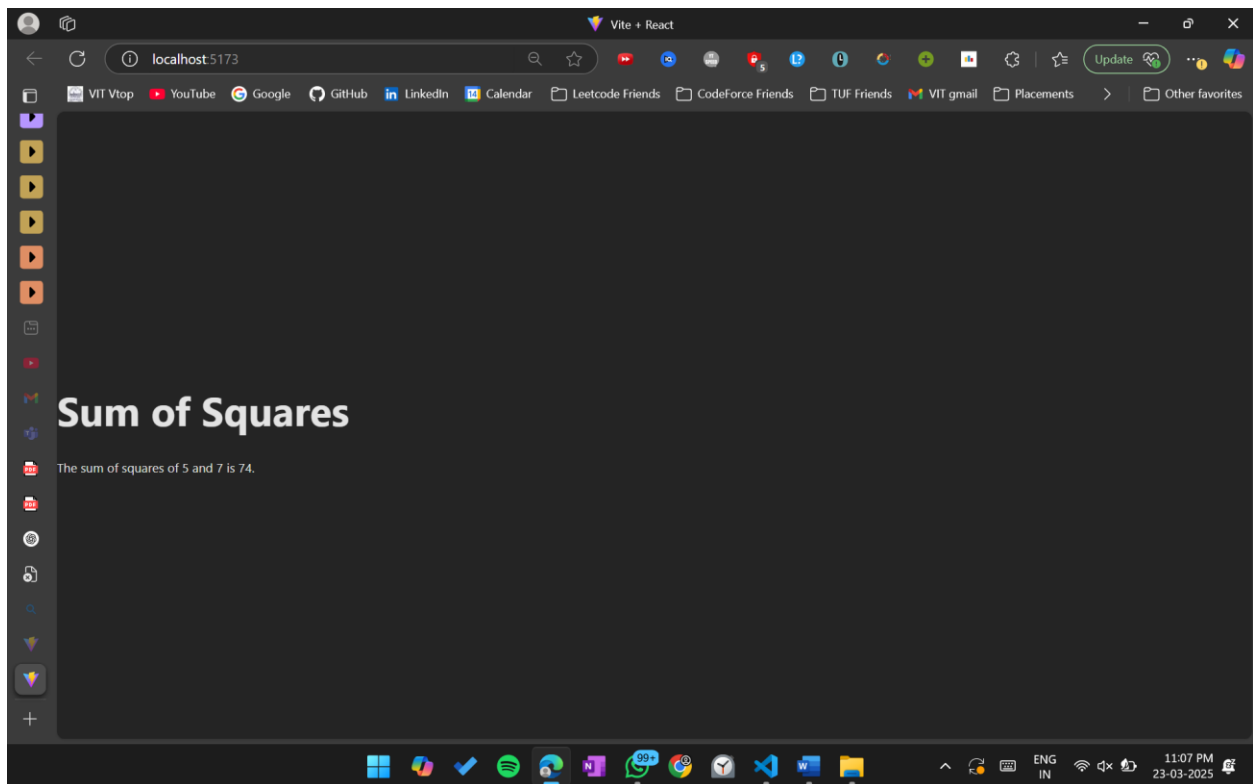

4. Create a component that displays the sum of squares of two numbers inside a `<p>` tag.

```
import React from 'react';

function SumOfSquares() {
  const num1 = 5;
  const num2 = 7;
  const sumOfSquares = num1 * num1 + num2 * num2;

  return <p>The sum of squares of {num1} and {num2} is {sumOfSquares}</p>;
}

export default function App() {
  return (
    <div>
      <h1>Sum of Squares</h1>
      <SumOfSquares />
    </div>
  );
}
```

5. Create a component that displays "Good Morning" if isMorning is true, otherwise display "Good Evening."

```
import React from 'react';
function Greeting() {
  const isMorning = true;

  return <p>{isMorning ? 'Good Morning' : 'Good Evening'}</p>;
}
export default function App() {
  return (
    <div>
      <h1>Greeting</h1>
      <Greeting />
    </div>
  );
}
```

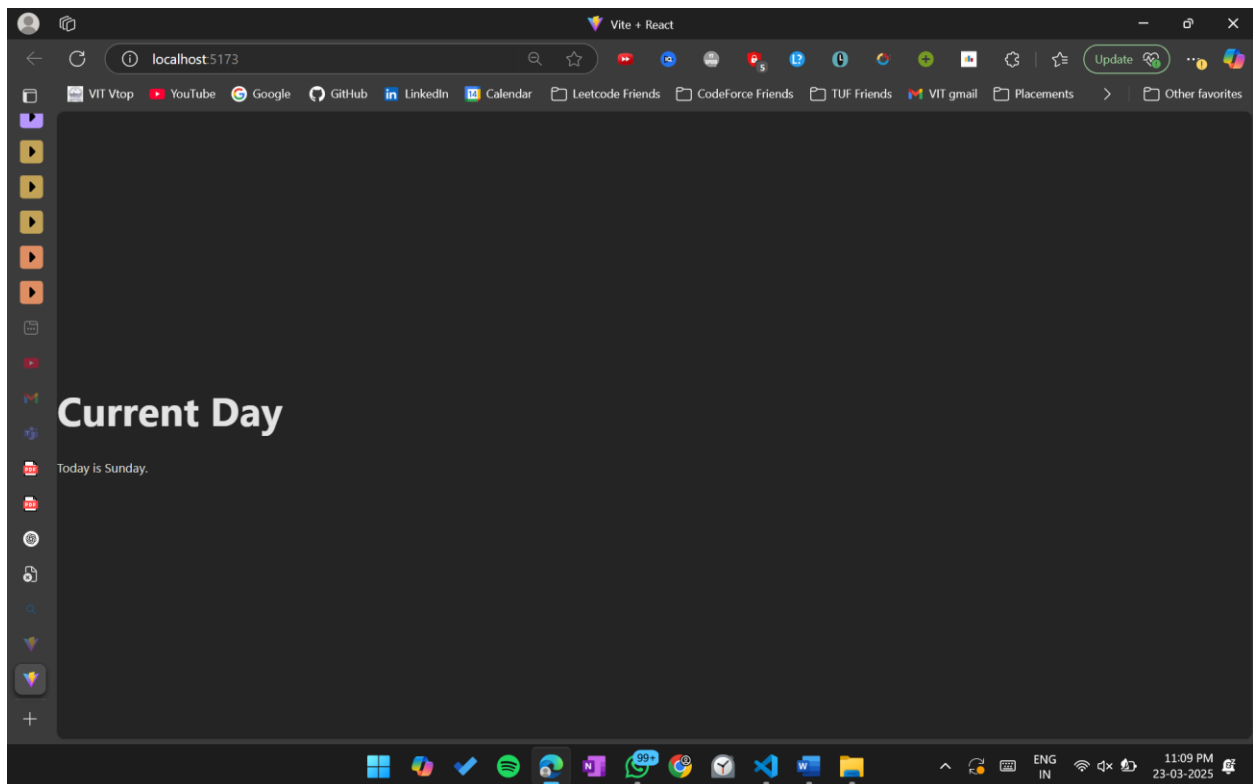

6. Create a React component that displays the current day of the week dynamically using JavaScript's

```
import React from 'react';
function CurrentDay() {
  const daysOfWeek = ['Sunday', 'Monday', 'Tuesday', 'Wednesday',
    'Thursday', 'Friday', 'Saturday'];
  const today = new Date();
  const currentDay = daysOfWeek[today.getDay()];

  return <p>Today is {currentDay}</p>;
}

export default function App() {
  return (
    <div>
      <h1>Current Day</h1>
      <CurrentDay />
    </div>
  );
}
```

7. Create a React component that checks whether a given number is prime and displays the result.

```
import React from 'react';

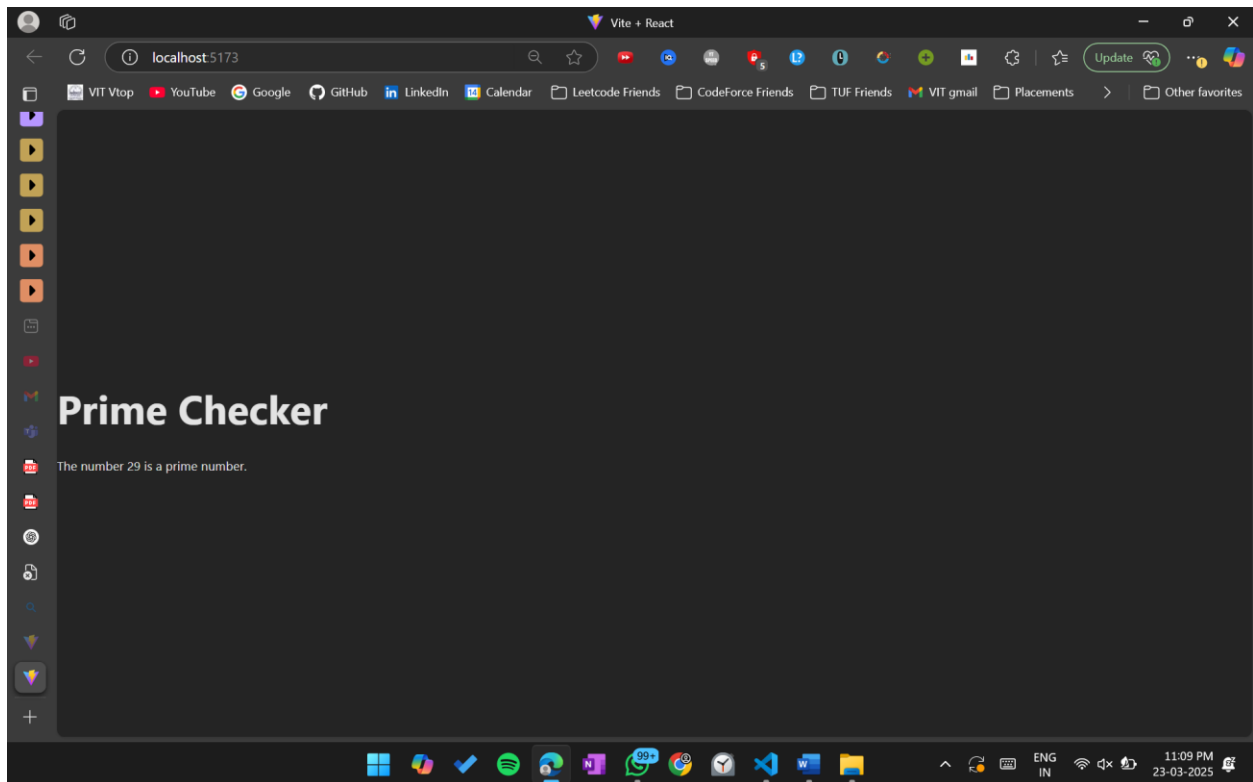

function isPrime(num) {
  if (num <= 1) return false;
  for (let i = 2; i <= Math.sqrt(num); i++) {
    if (num % i === 0) return false;
  }
  return true;
}

function PrimeChecker() {
  const number = 29;
  const result = isPrime(number) ? 'is a prime number' : 'is not a prime number';

  return <p>The number {number} {result}</p>;
}

export default function App() {
  return (
```

```
<div>
  <h1>Prime Checker</h1>
  <PrimeChecker />
</div>
);
}
```

8. Create a React class component called TemperatureConverter that allows the user to convert a temperature from Celsius to Fahrenheit and Fahrenheit to Celsius.

```
import React, { Component } from 'react';
class TemperatureConverter extends Component {
  constructor(props) {
    super(props);
    this.state = {
      temperature: '',
      scale: 'celsius',
    };
  }

  handleCelsiusChange = (e) => {
    this.setState({ temperature: e.target.value, scale: 'celsius' });
  };

  handleFahrenheitChange = (e) => {
    this.setState({ temperature: e.target.value, scale: 'fahrenheit' });
  };
}
```

```

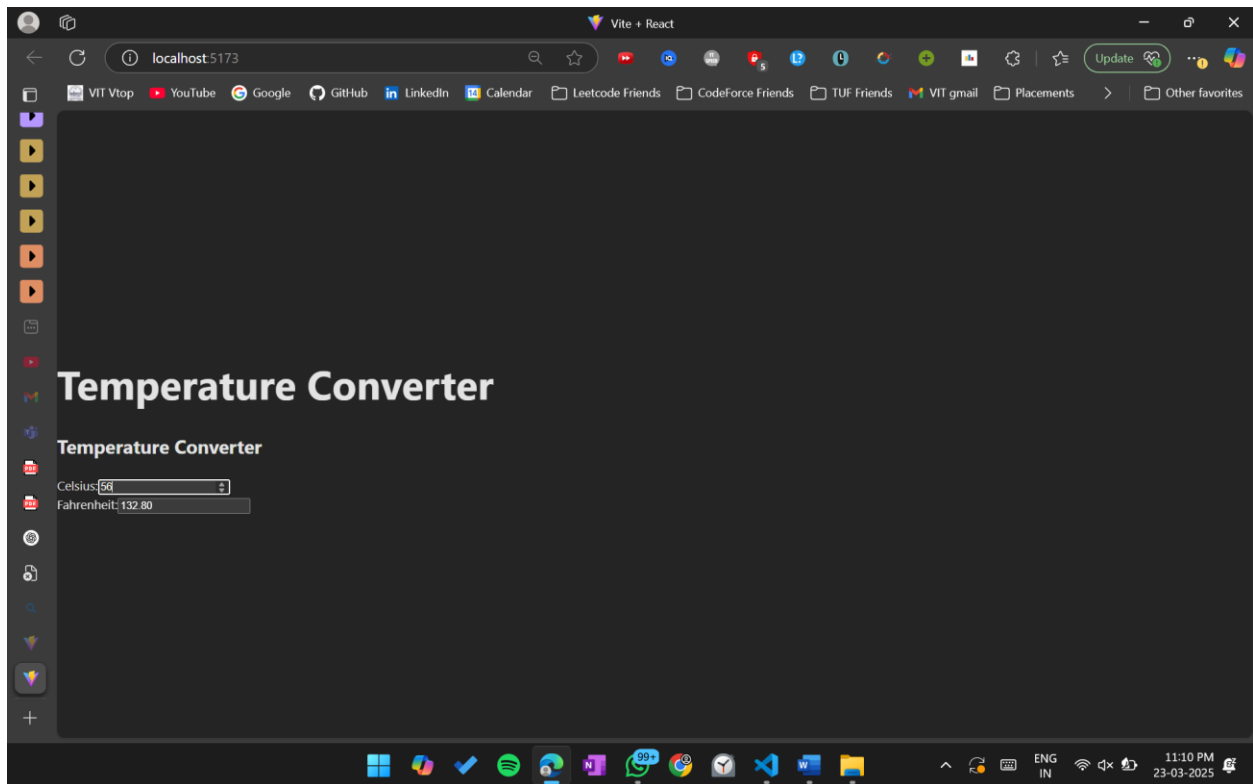

render() {
  const { temperature, scale } = this.state;
  const celsius =
    scale === 'fahrenheit' ? ((temperature - 32) * 5) / 9 : temperature;
  const fahrenheit =
    scale === 'celsius' ? (temperature * 9) / 5 + 32 : temperature;

  return (
    <div>
      <h2>Temperature Converter</h2>
      <div>
        <label>
          Celsius:
          <input
            type="number"
            value={scale === 'celsius' ? temperature :
celsius.toFixed(2)}
            onChange={this.handleCelsiusChange}
          />
        </label>
      </div>
      <div>
        <label>
          Fahrenheit:
          <input
            type="number"
            value={scale === 'fahrenheit' ? temperature :
fahrenheit.toFixed(2)}
            onChange={this.handleFahrenheitChange}
          />
        </label>
      </div>
    </div>
  );
}
}

export default function App() {
  return (
    <div>
      <h1>Temperature Converter</h1>

```

```
        <TemperatureConverter />
    </div>
);
}
```

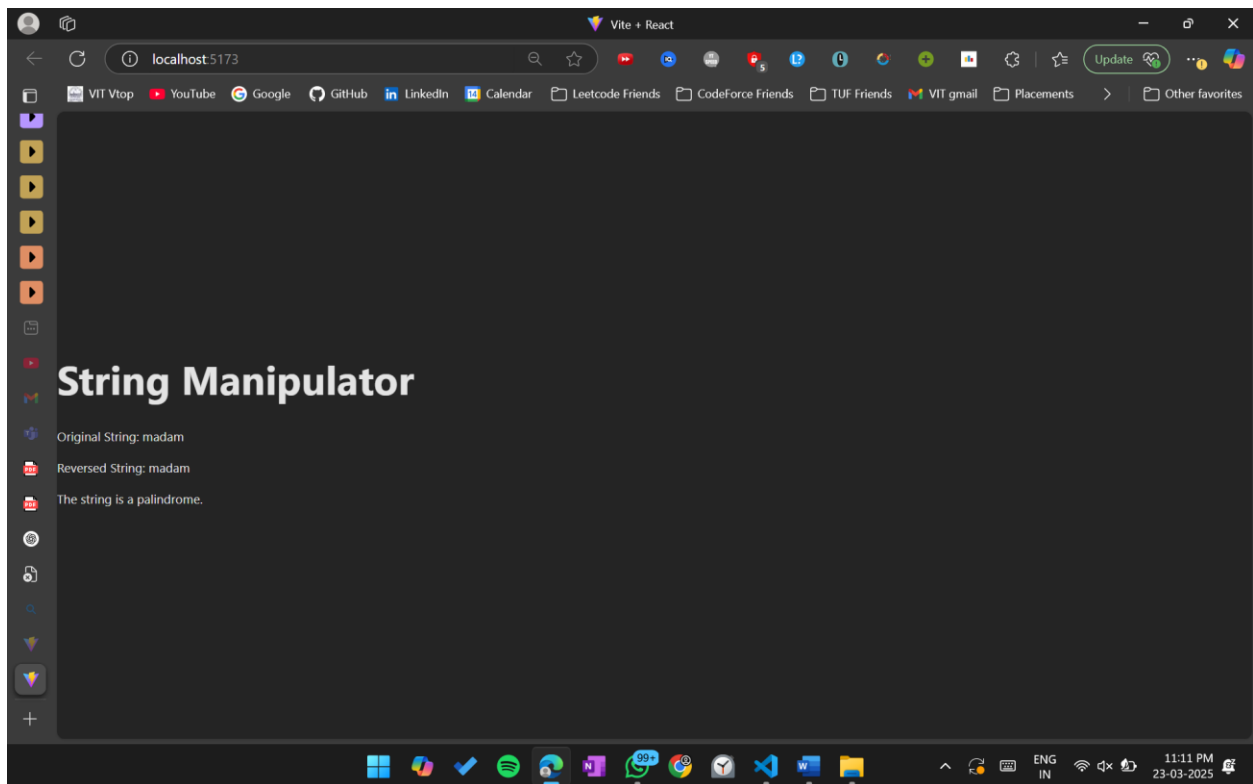

9. Create a component that takes a string (e.g., "React") and displays its reverse ("tcaeR") inside a `<p>` tag and display whether the string is palindrome or not

```
import React from 'react';
function StringManipulator() {
  const str = 'madam';
  const reversedStr = str.split('').reverse().join('');
  const isPalindrome = str === reversedStr;

  return (
    <div>
      <p>Original String: {str}</p>
      <p>Reversed String: {reversedStr}</p>
      <p>{isPalindrome ? 'The string is a palindrome.' : 'The string is not a palindrome.'}</p>
    </div>
  );
}

// Export the App component
export default function App() {
  return (
```

```
<div>
  <h1>String Manipulator</h1>
  <StringManipulator />
</div>
);
}
```

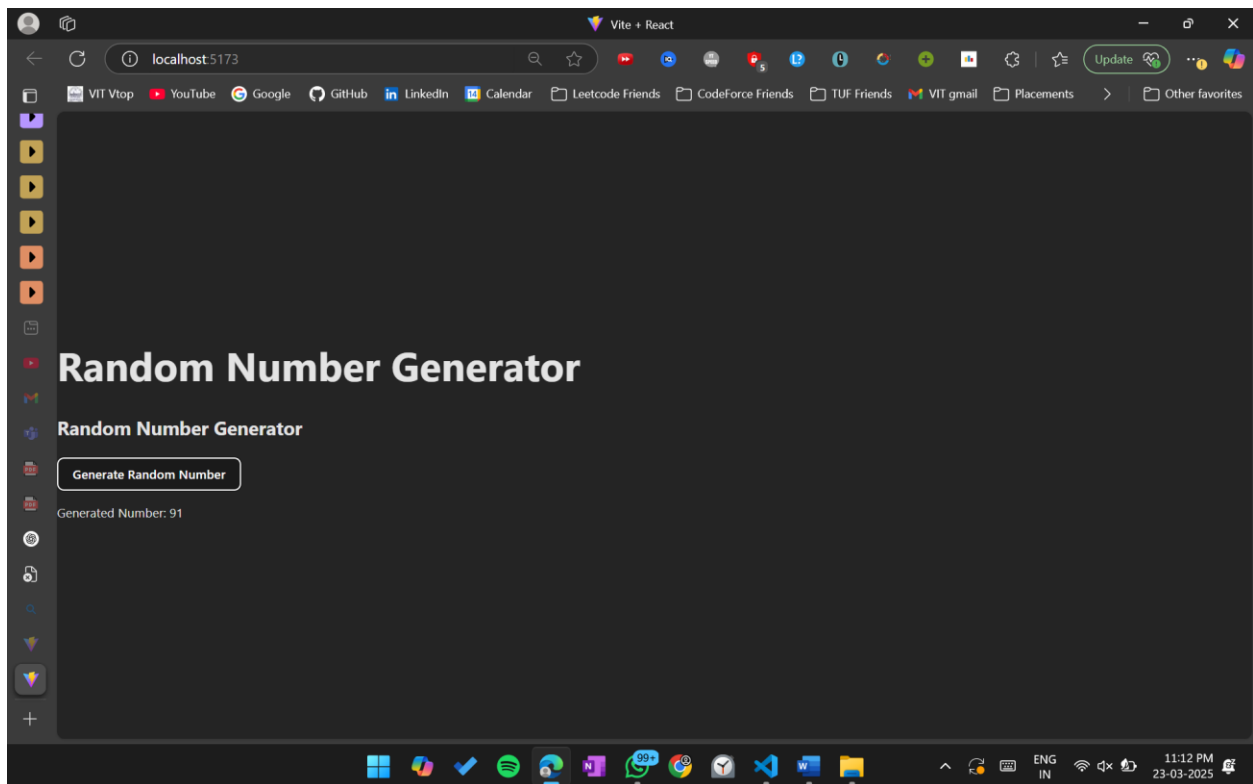

10. Create a button that, when clicked, generates and displays a random number between 1 and 100.

```
import React, { useState } from 'react';
function RandomNumberGenerator() {
  const [randomNumber, setRandomNumber] = useState(null);
  const handleClick = () => {
    const num = Math.floor(Math.random() * 100) + 1;
    setRandomNumber(num);
  };

  return (
    <div>
      <h2>Random Number Generator</h2>
      <button onClick={handleClick}>Generate Random Number</button>
      {randomNumber && <p>Generated Number: {randomNumber}</p>}
    </div>
  );
}
export default function App() {
  return (
```

```
<div>
  <h1>Random Number Generator</h1>
  <RandomNumberGenerator />
</div>
);
}
```

11. Check If a Year is a Leap Year: Take a year (e.g., 2024) as a variable and display whether it is a leap year or not

```
import React from 'react';
function LeapYearChecker() {
  const year = 2024;
  const isLeapYear =
    (year % 4 === 0 && year % 100 !== 0) || year % 400 === 0;
  return (
    <p>
      The year {year} is {isLeapYear ? 'a leap year.' : 'not a leap year.'}
    </p>
  );
}
export default function App() {
  return (
    <div>
      <h1>Leap Year Checker</h1>
      <LeapYearChecker />
    </div>
  );
}
```

**12. Create a React class component named `UserGreeting` that takes two props: `firstName` and `lastName`. Inside the `render()` method, display a greeting message with the full name of the user in the following format:
"Hello, [First Name] [Last Name]!"**

```
import React, { Component } from 'react';

class UserGreeting extends Component {
  render() {
    const { firstName, lastName } = this.props;
    return <p>Hello, {firstName} {lastName}!</p>;
  }
}

export default function App() {
  return (
    <div>
      <h1>User Greeting</h1>
      <UserGreeting firstName="Satyaprakash" lastName="swain" />
    </div>
  );
}
```

```
);  
}
```
